

CUSTOMER MILESTONE BRIEF

MS #53 - CloudBank Modern Oracle Reference Estate

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.53.0
Date	2026-09-01
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #53 - CloudBank Modern Oracle Reference Estate converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Lets operators select an already-modern Oracle microservices estate and see the exact database, transaction, messaging, identity, and operational risks an autonomous factory must resolve before moving it to PostgreSQL or another relational target.

Why this matters to a customer

Lets operators select an already-modern Oracle microservices estate and see the exact database, transaction, messaging, identity, and operational risks an autonomous factory must resolve before moving it to PostgreSQL or another relational target.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- An exact pin of Oracle's official CloudBank v5 reference application at commit 4f41b16d00c45503f691836fee8138010c969e86 with tree and UPL-1.0 license identities.
- A reproducible static inventory of 189 files, 70 Java source units, ten Maven modules, ten deployable units, nine SQL files, and 62 Spring/JAX-RS endpoint annotations.
- A selectable CloudBank Reference Estate company context alongside CardDemo and Oracle Customer (Large).
- Five business workloads covering customer/accounts, money transfer, cheque processing, identity/authorization, and credit scoring.
- Twenty curated migration-risk scenarios spanning Oracle schema semantics, LRA compensation, transactional messaging, security, audit triggers, nondeterminism, and operations.
- Explicit PostgreSQL, PostgreSQL-compatible distributed SQL, and other adapter-qualified relational candidate lanes with no prematurely selected target.

- A deterministic content-addressed graph fragment and receipt composed with the existing PL/I and Oracle Customer (Large) fragments.
- Cross-platform launchers, release documentation, deterministic checks, and adversarial target-overclaim rejection.

How it differs from earlier work

MS #52 made the enterprise Oracle reference source selectable. MS #53 adds a deliberately different source: Oracle's modern Java and Kubernetes CloudBank v5 application, proving the factory story covers database decoupling in contemporary microservices as well as visibly legacy estates.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank modern oracle reference estate as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The upstream CloudBank source is not vendored, built, or executed.
- The inventory and migration-risk projection are static source evidence, not runtime observations.
- CloudBank Reference Estate is a public reference estate, not an attached customer system.
- Candidate target lanes are options rather than a target selection or database mapping.
- No schema conversion, generated application refactoring, dual-run comparison, or native target execution is complete.
- PostgreSQL compatibility, target equivalence, application equivalence, migration completion, and production readiness remain false.

Source of record

- CHANGELOG.md release section(s): 0.53.0
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity
