

CUSTOMER MILESTONE BRIEF

MS #56 - First CloudBank Dark Factory Run

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete - execution passed
Release	0.56.0
Date	2026-09-02
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Published execution result

Published 2026-09-11: Customer application dark factory run. The original signed receipt is retained in the completed MS67 evidence chain.

Executive summary

MS #56 - First CloudBank Dark Factory Run converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Turns the customer mapping into an isolated, receipt-gated workcell that can prove one bounded Spring contract on Oracle and PostgreSQL without changing the pinned source.

Why this matters to a customer

Turns the customer mapping into an isolated, receipt-gated workcell that can prove one bounded Spring contract on Oracle and PostgreSQL without changing the pinned source.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A sealed work order that copies the complete pinned cloudbank-v5 source into isolation and admits exactly six customer-service paths.
- Content-addressed templates for Maven, PostgreSQL datasource and Hibernate settings, Liquibase SQL, the JPA entity, and the shared test.
- A deterministic worker that rejects source drift and applies only the six edits through the existing patch broker.
- One shared Oracle and PostgreSQL Spring/JPA contract for four synthetic rows, defaults, empty strings, case-sensitive searches, CRUD, and owner/admin authorization.

- A baseline-first gate that passes unchanged source on the admitted Oracle image before testing the generated service on PostgreSQL 16.
- A signed receipt chained to the MS #54 and MS #55 receipts, immutable images, factory receipt, work order, mapping, and transformation plan.
- Ephemeral loopback-only ports and exclusion of credentials, raw Maven output, demonstration passwords, and production data.
- Cross-platform launchers, schemas, Control Tower status, CI checks, deterministic artifacts, and adversarial tests.

How it differs from earlier work

MS #54 established signed Oracle evidence and MS #55 established the signed PostgreSQL mapping. MS #56 chains them into the first baseline-first CloudBank application transformation, limited to one synthetic customer-service contract.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use first cloudbank dark factory run as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- These boundaries describe MS #56's own evidence scope. Later MS65, MS66 and MS67 receipts add their separate nonproduction qualifications; they do not rewrite this milestone's signed fields.
- Execution requires operator-held signed MS #54 and MS #55 receipts plus the same verification key.
- A passing receipt proves only the declared synthetic customer-application contract.
- The shared parent still supplies Oracle libraries outside this six-file workcell.
- HTTP transport, concurrency, CDC, cutover, rollback, packaging, and production-shaped data remain outside this proof.
- Human promotion, whole-CloudBank equivalence, migration completion, production-data equivalence, and production readiness remain false.
