

CUSTOMER MILESTONE BRIEF

MS #58 - CloudBank Whole-Application Transaction Wave

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Plan admitted
Release	0.58.0
Date	2026-09-02
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Published execution result

Published 2026-09-11: Transaction wave plan admission. The original signed receipt is retained in the completed MS67 evidence chain.

Executive summary

MS #58 - CloudBank Whole-Application Transaction Wave converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Places every deployable CloudBank service under one governed migration sequence and prepares the first connected money-movement wave without confusing a complete plan with a completed migration.

Why this matters to a customer

Places every deployable CloudBank service under one governed migration sequence and prepares the first connected money-movement wave without confusing a complete plan with a completed migration.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A complete inventory of all eight root deployable services with every service assigned exactly once to a delivery wave.
- An ordered whole-application plan covering qualified Customer, Account/Transfer transaction core, messaging/authorization, edge/auxiliary services, and production-like operations.

- An exact 17-file Account and Transfer source contract bound to the pinned CloudBank commit and trees.
- A 13-column PostgreSQL 16 mapping for Accounts and Journal tables, identities, constraints, timestamps, foreign keys, and explicit money-precision policy.
- A transaction behavior contract covering success, invalid amounts, insufficient funds, deposit failure, duplicate commands, authorization denial, crash recovery, and journal replay.
- A deterministic recovery state-model rehearsal for value conservation, compensation, idempotency, authorization order, checkpoint resume, and exact journal reconstruction.
- A compatibility ledger that keeps Oracle AQ/JMS and MicroTx LRA replacement blocked on native semantic evidence.
- A signed admission receipt chained to the MS #57 receipt and immutable Oracle and PostgreSQL image identities, plus schemas, launchers, CI, Control Tower status, documentation, and adversarial tests.

How it differs from earlier work

MS #57 qualified the bounded Customer service. MS #58 accounts for the whole deployable portfolio and chains that result into an admission-ready Customer, Account, and Transfer transaction wave while preserving native execution as later evidence.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank whole-application transaction wave as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- These boundaries describe MS #58's own evidence scope. Later MS65, MS66 and MS67 receipts add their separate nonproduction qualifications; they do not rewrite this milestone's signed fields.
- The milestone inventories and plans the whole application; it does not claim the whole application has migrated.
- The committed readiness receipt is static admission evidence, not native Account or Transfer execution.
- The recovery rehearsal is a deterministic state model, not a live distributed transaction or broker observation.

- Oracle AQ/JMS and MicroTx LRA replacement remain unresolved until ordering, atomicity, retry, compensation, and recovery pass natively.
- Target Account and Transfer code is not generated by this milestone.
- Production data is not accessed, copied, profiled, or implied.
- Whole-CloudBank equivalence, migration completion, production-data equivalence, and production readiness remain false.
