

CUSTOMER MILESTONE BRIEF

MS #52 - Oracle Customer (Large) Control Tower Projection

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.52.0
Date	2026-09-01
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #52 - Oracle Customer (Large) Control Tower Projection converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Lets operators explore a large Oracle reference estate through business-facing order-to-cash and procure-to-pay workloads without presenting public reference evidence as an attached customer system.

Why this matters to a customer

Lets operators explore a large Oracle reference estate through business-facing order-to-cash and procure-to-pay workloads without presenting public reference evidence as an attached customer system.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A selectable Oracle Customer (Large) company context in the read-only Control Tower.
- Order-to-cash and procure-to-pay business problems and workloads bound to the two curated nine-table reference slices.
- Twenty static document-flow trace scenarios covering order, shipment or receipt, invoice, payment, and allocation relationships.
- A deterministic content-addressed graph fragment and receipt bound to the exact canonical graph, source commit, tree, inventory, selectors, and slice evidence.
- Composition with the existing PL/I extension while retaining the canonical CardDemo graph as the runtime and audit identity.
- POSIX and Windows build and verification launchers plus adversarial naming, drift, provenance, platform, and overclaim tests.

How it differs from earlier work

MS #48 pinned and measured the upstream reference estate, MS #50 broadened Oracle semantic coverage, and MS #51 defined native execution admission. MS #52 now projects the two curated business slices into the Control Tower under the operator-facing name Oracle Customer (Large) while preserving the earlier evidence boundaries.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use oracle customer (large) control tower projection as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- Oracle Customer (Large) is an operator-facing public reference-estate label; no customer system is attached.
- iDempiere remains only as upstream source, commit, tree, license, and internal evidence provenance.
- The 20 projected relationships are curated static trace scenarios, not native Oracle execution or observed transactions.
- The projection does not change the canonical CardDemo graph or promote its runtime and audit claims.
- Native Oracle conformance, application equivalence, CloudBank mapping, migration completion, and production readiness remain false.
