

CUSTOMER MILESTONE BRIEF

MS #49 - Oracle Dialect Authority Corpus and Executable Fixtures

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.49.0
Date	2026-09-01
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #49 - Oracle Dialect Authority Corpus and Executable Fixtures converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Replaces Oracle-semantics assumptions with a pinned official source corpus and executable cases while keeping native-database proof visibly separate.

Why this matters to a customer

Replaces Oracle-semantics assumptions with a pinned official source corpus and executable cases while keeping native-database proof visibly separate.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- An Oracle Database Sample Schemas v23.3 pin at commit e3325a83e56c516815844025418a96ecaf219751 with exact tree and MIT license identities.
- An allowlisted nine-file corpus spanning customer_orders, human_resources, and sales_history: four SQL files, 2,000 SQL lines, and 77,919 bytes.
- Eight executable fixtures and 24 deterministic cases covering empty-string/null, NUMBER precision and scale, DATE arithmetic, NVL/DECODE coercion, ROWNUM ordering, SELECT FOR UPDATE, SELECT INTO/NO_DATA_FOUND, and LOB boundaries.
- A content-addressed model-conformance receipt recording all 24 cases as passed-bounded-model while native execution and equivalence flags remain false.
- A fail-fast native Oracle SQL harness with one completion marker for each fixture and no simulated native result.
- CLI, POSIX shell, and PowerShell build and verification paths for acquisition, generated artifacts, hashes, schemas, results, and claim boundaries.
- JSON schemas plus adversarial tests that reject altered content, rehashed native-execution overclaims, and application-equivalence overclaims.

How it differs from earlier work

MS #43 introduced the bounded Oracle adapter and MS #48 selected iDempiere plus the first eight semantic risks. MS #49 acquires the official Oracle dialect authority, executes a deterministic local semantics model, and emits a native Oracle harness without promoting either activity into iDempiere application equivalence.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use oracle dialect authority corpus and executable fixtures as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The selected corpus is a deliberately bounded official-source subset, not the complete sample-schema repository or its bulk data.
- The deterministic local semantics model does not constitute native Oracle execution or conformance.
- The native SQL harness is generated but unexecuted; no authorized database identity, session, transaction, lock, or LOB runtime evidence is claimed.
- No iDempiere application behavior or customer transaction is executed or proven equivalent.
- No iDempiere-to-CloudBank mapping is complete.
- Native Oracle conformance, application equivalence, migration completion, and production readiness remain false.
