

CUSTOMER MILESTONE BRIEF

MS #50 - Oracle Semantic Coverage Program

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.50.0, 0.50.1
Date	2026-09-01
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #50 - Oracle Semantic Coverage Program converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Gives database architects a quantified, evidence-levelled Oracle coverage answer and advances it through a broad, executable core SQL and datatype tranche.

Why this matters to a customer

Gives database architects a quantified, evidence-levelled Oracle coverage answer and advances it through a broad, executable core SQL and datatype tranche.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A catalog of 500 stable Oracle behavior contracts and 2,000 case specifications across ten exact domains.
- Oracle documentation authority, a 19c baseline, a 26ai delta, and four required case dimensions for every behavior.
- Bounded execution of 920 governed cases across all 230 behaviors in types, globalization, expressions, and queries.
- Separately declared expectations and independently computed observations across 46 topic families, five behavior focuses, and four case dimensions.
- A deduplicated evidence ladder reporting 500 catalogued, 233 unique bounded-model verified, 0 native-verified, and 0 target-equivalent behaviors.
- A native execution plan plus deterministic artifacts, four JSON Schemas, cross-platform verification, and adversarial drift, mutation, overlap, and overclaim tests.

How it differs from earlier work

MS #49 proved the mechanism with eight fixtures and 24 cases. MS #50.0 made them bootstrap evidence inside a governed broad-coverage program; MS #50.1 executes the first 920 catalog cases without promoting bounded-model evidence into native Oracle proof.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use oracle semantic coverage program as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The 920 passed catalog cases are deterministic bounded-model evidence; they do not constitute native Oracle execution or conformance.
- The remaining 1,080 catalog cases have not executed.
- The 24 MS #49 bootstrap runs remain separate evidence records; five behavior bindings overlap the core tranche and are not double-counted.
- No native Oracle 19c or 26ai execution receipt exists.
- Catalogued is not supported; bounded-model verified is not native conformant; native verified is not target equivalent.
- iDempiere projection and CloudBank mapping remain incomplete.
- Native conformance, application equivalence, migration completion, and production readiness remain false.

Source of record

- CHANGELOG.md release section(s): 0.50.0, 0.50.1
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
