

CUSTOMER MILESTONE BRIEF

MS #68 - iDempiere Dialect Inventory and Pairing

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete - deterministic source-bound evidence
Release	0.68.0
Date	2026-09-11
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #68 - iDempiere Dialect Inventory and Pairing converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Accounts for every current Oracle and PostgreSQL migration script in the pinned iDempiere estate and gives the next comparison stage a reproducible coverage denominator.

Why this matters to a customer

Accounts for every current Oracle and PostgreSQL migration script in the pinned iDempiere estate and gives the next comparison stage a reproducible coverage denominator.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- All 1,078 Oracle and 1,078 PostgreSQL current migration scripts paired at the existing release-13 commit, with no unpaired files.
- A deterministic pairing manifest with 1,077 exact release and filename matches and one unique same-release IDEMPIERE-5963 ticket match.
- A 93-pair order-to-cash pilot selected from lexical references to the existing nine-table business slice.
- Logical and transport hashes for every script, plus 31 observed logical-content-identical pairs without a semantic-equivalence verdict.
- A nine-file database-provider and conversion boundary, including the logger that writes both Oracle and PostgreSQL migration outputs.
- A content-addressed Stage 1 receipt, two schemas, source-bound rebuild verification, POSIX and PowerShell launchers, and tests for tampering and unsupported claims.

How it differs from earlier work

MS #48 pinned and inventoried iDempiere, MS #52 projected the estate, and MS #33 established the database semantic core. MS #68 reuses those assets to audit paired dialect outputs. MS #69 will compare semantics and MS #70 will triage findings and assemble evidence. CloudBank production-readiness work remains unnumbered and is not repeated here.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use idempiere dialect inventory and pairing as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- Stage 1 proves file-level pairing coverage and pilot selection for one exact public-source commit; it does not prove parser coverage or semantic equivalence.
- Independent hand maintenance is unproven because iDempiere includes a converter and a dual-dialect migration logger. Per-pair provenance remains unclassified.
- The pilot selector is lexical and does not yet distinguish executable references from comments.
- No model was called and Builder remained unused. Deterministic comparison and bounded triage remain planned work.
- No native database execution, whole-application equivalence, migration completion, customer readiness or production readiness is claimed.
