

CUSTOMER MILESTONE BRIEF

MS #65 - CloudBank Production-Like Deployment and Cutover Rehearsal

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.65.0
Date	2026-09-03
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #65 - CloudBank Production-Like Deployment and Cutover Rehearsal converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Turns the eight-service target into a hardened deployment bundle and requires backup, cutover, rollback, recovery, and service-level evidence before any production decision.

Why this matters to a customer

Turns the eight-service target into a hardened deployment bundle and requires backup, cutover, rollback, recovery, and service-level evidence before any production decision.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A signed MS #64 receipt chain, pinned source, and fresh isolated eight-service materialization.
- Digest-only images bound to a site profile, cluster identity, namespace, configuration hash, and external secret names.
- A deterministic Kubernetes bundle with two replicas, safe rolling updates, three health probes, resource bounds, disruption budgets, dedicated service accounts, and restricted containers.
- Default-deny networking with bounded internal, ingress, DNS, PostgreSQL, and model egress.
- Twenty-four signed checks for rollout, backup and exact restore, smoke, canary, traffic switch, business checks, mandatory rollback, recovery, and a 100-request zero-error SLO window.
- Deterministic contracts and receipts, cross-platform launchers, CI, Control Tower projection, schemas, documentation, and adversarial tests.

How it differs from earlier work

MS #64 executed all eight target workcells. MS #65 binds that signed result to immutable images and an authorized non-production rehearsal; customer production remains a separate decision.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank production-like deployment and cutover rehearsal as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The committed receipt proves only that the renderer and admission gate are ready; a passing execution receipt proves only a bound non-production rehearsal with synthetic data.
- No secret values, production data, backups, raw logs, prompts, responses, or customer runtime output are stored.
- Native CDC, customer change authority, enterprise identity and secret rotation, Oracle AQ equivalence, real credit decisions, model quality, whole-application equivalence, migration completion, production deployment, and production readiness remain false.
