

CUSTOMER MILESTONE BRIEF

MS #61 - CloudBank Bounded Oracle/PostgreSQL Equivalence

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.61.0
Date	2026-09-02
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #61 - CloudBank Bounded Oracle/PostgreSQL Equivalence converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Converts separate Oracle source and PostgreSQL target evidence into one receipt-gated behavioral comparison for the migrated Customer, Account, and Transfer boundary.

Why this matters to a customer

Converts separate Oracle source and PostgreSQL target evidence into one receipt-gated behavioral comparison for the migrated Customer, Account, and Transfer boundary.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A signed MS #57 and MS #60 receipt chain requiring the same evidence key and matching immutable PostgreSQL image identity.
- One seven-scenario normalized observation contract covering conservation, invalid input, insufficient funds, failure recovery, Transfer validation, identity rejection, and successful orchestration.
- An isolated pinned-source lane executing original Account state transitions against native Oracle and original Transfer orchestration against controlled HTTP collaborators.
- An isolated generated-target lane requalifying Account against native PostgreSQL and executing the generated Transfer facade contract.
- An exact comparison of content-addressed observation markers across both lanes with seven passing tests and two test reports required per lane.
- A compatibility ledger that records LRA compensation versus local atomic rollback, the source failure journal, and target idempotency as explicit differences.
- Sequential database execution, generated credentials, loopback-only ports, synthetic data, non-persisted raw output, and safe aggregate diagnostics.

- Deterministic contracts, readiness and execution schemas, cross-platform launchers, CI compilation, Control Tower projection, documentation, and adversarial tamper and overclaim tests.

How it differs from earlier work

MS #57 proved the Customer service in native Oracle and PostgreSQL lanes, while MS #60 proved the connected Account/Transfer target on PostgreSQL. MS #61 binds both signed results and adds a shared native comparison without presenting different transaction implementations as identical.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank bounded oracle/postgresql equivalence as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The committed readiness receipt proves that the contracts and runners are ready, not that the operator executed either native lane.
- A passing receipt establishes bounded normalized Customer, Account, and Transfer equivalence, not identical internal implementation.
- The original integrated Account/Transfer HTTP wave is not started with a real Oracle MicroTx coordinator; original Transfer orchestration is exercised against controlled collaborators.
- Oracle LRA compensation and PostgreSQL local atomic rollback remain intentionally different, and the Oracle zero-amount failure journal remains visible in the ledger.
- Production OAuth/OIDC and customer identity infrastructure are not qualified.
- Checks AQ/JMS and the remaining five service workcells are not migrated or qualified.
- No production data, whole-application equivalence, migration completion, production promotion, or production readiness is claimed.
