B06 | October 13, 2026 | 9 AM-noon PDT

Readiness checked October 12 against the supplied instruction. Exact implementation: **62eafdaf29dce1d40603d38c3a394f150b98f686**. No native execution, model call, private-key read, signing, pull, container start, settings change or merge.

Prerequisite	Ready?	Evidence / action
Execution worktree	Yes	Separate detached clean checkout at exact 62eafdaf; keep pinned.
Line endings / hashes	Yes	873 tracked bound files match; LF source hashes and 14 existing compiled classes verified.
Offline preflight	Yes	111,311 files/seals passed from exact checkout in 119 sec; repeat at 8:30.
Engineering authority	Yes	Existing public fingerprint 4ce00cfa...367be9f0 accepted; qualification rejected.
8768 Tower	Not needed	Engineering supervisor/worker use local cancellation and signed ledger/cleanup. Leave stopped.
Docker memory / CPUs	Yes	31.04 GiB / 24 CPUs exceeds 28 GiB / 11. No .wslconfig. No restart/change needed.
Host free memory	8:00 step	12.17 GiB free; Howard closes unnecessary apps normally and rechecks.
Python	Yes	native-venv Python 3.12.10 meets repository >=3.11; no separate request pin.
Request / assets	Yes	Request 663fa537...344fc9 and seal 107c2073...7900f35; full inventory unchanged.
Output root	Yes	Fresh/absent; writable existing parent; no active lock/prior attempt; 611.59 GiB free.
No overlap	Yes*	Six registered windows closed; related monitors paused; no native worker found.
Go line	Yes	Exact 62eafdaf / 107c2073 go received; no attempts consumed.

* Live Docker overlap/image/lease checks are mandatory in the approved launch gate; they were not queried tonight. If anything changes, refuse launch. Full evidence and code references: b06-oct13-runbook.md and b06-readiness-instruction-2026-10-12.json.

Verified paths; commands are deferred

# At 8:30: run ONLY the offline preflight block in b06-oct13-runbook.md.
# At 9:00, after go/no-go: run its separate one-attempt invocation block.
```

Morning checklist

8:00 Howard: save work, close unnecessary apps, check memory. Largest user process groups: Chrome 10.09 GiB, OneDrive 9.29 GiB, ChatGPT 3.21 GiB, Claude 1.20 GiB. Working sets share pages and are not additive. Check sync before quitting OneDrive. Do not stop Memory Compression, Windows services, WSL or Docker.

8:30 Codex: read-only exact-checkout preflight, hashes/seals, output/lease and registered windows. **8:45:** go/no-go. **9:00:** invoke strict attempt 1 separately; **latest 9:40**. Work 3,600s + cleanup 600s; candidate 1,800s. No extension or automatic retry.

Between attempts: show signed terminal/owner/mode/consumed number, request/plan/source/artifact hashes; first unmatched/lifecycle/phase evidence, witness classes, heap/guard/dump/output; authenticated cleanup and actual resource absence; elapsed/remaining time. Howard reviews, then a separate attempt 2 invocation, diagnostic cap 10, **latest 10:50**. No third attempt. Noon is absolute.

Part 6 and release of the hold

Fill the existing Part 6 template with both outcomes, counts/bytes/heap, first unmatched sequence, lifecycle/phase evidence, witnesses, terminal/archive and verified cleanup. Cause requires the preregistered lifecycle explanation or the same operation near 12,400 in both attempts; otherwise cause not identified and stop repair. Only authenticated sealed cleanup can lift the merge hold. No qualification/measurement credit.

No known prerequisite requires a later window. If checks/review cannot finish by 9:40, propose a new window; never compress checks. Readiness does not promise a successful native outcome. **READY** - only listed morning steps and fresh launch guards remain.
