

CUSTOMER MILESTONE BRIEF

MS #28 - Enterprise Collection Appliance

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.28.0
Date	2026-08-28
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #28 - Enterprise Collection Appliance converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Packages governed source collection and failure testing for customer environments that cannot expose their estate directly.

Why this matters to a customer

Packages governed source collection and failure testing for customer environments that cannot expose their estate directly.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- Added a content-addressed enterprise collection-appliance profile bound to the existing three-adapter mainframe access campaign.
- Added bounded bearer, externally issued OAuth bearer, and mTLS-plus-bearer authentication profiles with TLS 1.2 minimum transport and credential-free configuration.
- Added continuation-only pagination, bounded retry and Retry-After, global response limits, and fail-closed redirect and continuation validation.
- Proved a forced interruption after page two followed by content-addressed checkpoint resume without repeating completed adapter work.
- Added digest-and-redacted-claims-only retention with seven-day checkpoint and thirty-day evidence policy bounds; raw bodies and credentials are never retained.
- Added an eight-scenario deterministic fault laboratory covering DNS, TLS, timeout, redirects, pagination loops, rate limits, truncation, and checkpoint tampering.
- Published the appliance posture in the unified capability projection while keeping all live, mainframe-equivalence, enterprise-IdP, customer-vault, purge-scheduler, and production claims blocked.

How it differs from earlier work

MS #28 builds on MS #27 (Offline Data Movement and CDC Rehearsal). The earlier milestone established its own bounded capability; this milestone adds enterprise collection appliance while preserving the earlier evidence and its limits.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use enterprise collection appliance as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- This milestone establishes only the bounded capabilities and evidence listed here; later capabilities are not retroactive.
- Production readiness and platform equivalence require the explicit evidence and policy gates applicable to the customer environment.
