

CUSTOMER MILESTONE BRIEF

MS #50 - Oracle Semantic Coverage Program

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.50.0, 0.50.1, 0.50.2
Date	2026-09-01
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #50 - Oracle Semantic Coverage Program converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Gives database architects a quantified, evidence-levelled Oracle coverage answer and advances it through broad core SQL, datatype, and PL/SQL execution tranches.

Why this matters to a customer

Gives database architects a quantified, evidence-levelled Oracle coverage answer and advances it through broad core SQL, datatype, and PL/SQL execution tranches.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A catalog of 500 stable Oracle behavior contracts and 2,000 case specifications across ten exact domains.
- Bounded execution of 920 governed cases across 230 core SQL/type behaviors and 320 cases across all 80 PL/SQL behaviors.
- PL/SQL coverage spanning blocks, exceptions, parameter modes, package state, cursors, bulk operations, dynamic SQL, triggers, and autonomous transaction boundaries.
- Separately declared expectations and independently computed observations across 62 topic families, five behavior focuses, and four case dimensions.
- A deduplicated evidence ladder reporting 500 catalogued, 310 catalog-executed, 312 unique bounded-model verified, 0 native-verified, and 0 target-equivalent behaviors.
- Native execution plans plus deterministic artifacts, six JSON Schemas, cross-platform verification, and adversarial dependency-drift, mutation, overlap, and overclaim tests.

How it differs from earlier work

MS #49 proved the mechanism with eight fixtures and 24 cases. MS #50.0 made them bootstrap evidence inside a governed broad-coverage program; MS #50.1 executes the first 920 core SQL/type catalog cases and MS #50.2 executes all 320 PL/SQL cases without promoting bounded-model evidence into native Oracle proof.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use oracle semantic coverage program as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The 1,240 passed catalog cases are deterministic bounded-model evidence; they do not constitute native Oracle execution or conformance.
- The remaining 760 catalog cases have not executed.
- The 24 MS #49 bootstrap runs remain separate evidence records; six behavior bindings overlap executed catalog tranches and two remain bootstrap-only.
- Dynamic SQL, trigger, package-state, and autonomous transaction observations are bounded simulations, not native platform evidence.
- No native Oracle 19c or 26ai execution receipt exists.
- Catalogued is not supported; bounded-model verified is not native conformant; native verified is not target equivalent.
- iDempiere projection, CloudBank mapping, application equivalence, migration completion, and production readiness remain false.

Source of record
