

CUSTOMER MILESTONE BRIEF

MS #01 - Source-Faithful Local Oracle

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.1.0 (historical initial commit)
Date	2026-08-10
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #1 - Source-Faithful Local Oracle converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Creates a trustworthy local reference for one real CardDemo business process so modernization output can be compared against preserved legacy behavior.

Why this matters to a customer

Creates a trustworthy local reference for one real CardDemo business process so modernization output can be compared against preserved legacy behavior.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A cross-platform Python oracle for the INTCALC batch workload.
- Fixed-width CardDemo record parsing and COBOL signed-zoned-decimal support.
- Deterministic account and transaction outputs with a hashed evidence receipt.
- A candidate comparator that reports exact business-field differences.
- A source-faithful policy that preserves the discovered final-account edge case.

How it differs from earlier work

This is the starting engineering milestone. It creates the executable behavioral reference that later graph, factory, qualification, and customer-pilot work can govern.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use source-faithful local oracle as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The oracle is derived from source and is not independent proof of z/OS behavior.
- VSAM locking, JES, Language Environment behavior, and EBCDIC collation are not emulated.
- Production equivalence requires corroborating authorized legacy execution evidence.

Source of record

- CHANGELOG.md release section(s): 0.1.0 (historical initial commit)
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity

The underlying schemas, receipts, ledgers, tests, and policy decisions remain authoritative when greater detail is required.
