

CUSTOMER MILESTONE BRIEF

MS #21 - Mainframe Access Readiness Campaign

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.21.0, 0.21.1
Date	2026-08-26 to 2026-08-26
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #21 - Mainframe Access Readiness Campaign converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Turns separate mainframe connectors into one governed, read-only readiness and capability view.

Why this matters to a customer

Turns separate mainframe connectors into one governed, read-only readiness and capability view.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- Turned the z/OSMF, Db2 for z/OS catalog, and CICS CMCI contracts into one executable read-only mainframe access campaign with an exact-adapter-set aggregate receipt.
- Added a no-redirect, verified-HTTPS, GET-only transport with bounded response reads, external bearer credentials, sanitized failures, and no raw-body retention.
- Added IBM-shaped z/OSMF step-data and CICS CMCI resource parsing plus a deliberately bounded customer-approved Db2 catalog REST projection.
- Added a credential-free access profile that binds remote observations to exact graph entities and rejects extra adapters, unsafe paths, secret-shaped configuration, and unbounded settings.

- Added separate live evidence signing, graph-bound per-adapter envelopes, and aggregate validation for missing, duplicate, mixed-class, invalid, unsigned, or drifted captures.
- Added deterministic simulated campaign evidence, POSIX and PowerShell launchers, JSON schemas, a customer access runbook, and adversarial transport/parser/receipt tests.
- Kept `production_ready: false`: passing collection proves bounded read-only observations, not source equivalence, performance, CDC, cutover, rollback, or production promotion.
- Replaced the four-cell capability view with one evidence-bound projection spanning runtime, language, and data capabilities: CICS, VSAM, IMS, HLASM, PL/I, and Db2/Data.
- Added explicit capability kinds so discovery, development proof, and live-mainframe equivalence are compared without treating languages, runtimes, and data platforms as interchangeable.
- Bound the projection to the canonical graph, extension catalog, PL/I fragment, PostgreSQL and Oracle offline receipts, and the mainframe-access campaign receipt.
- Made the PL/I reference proof visible as discovery-ready but not development-ready, and made the Db2 multi-target proof visible as development-ready but not live-mainframe-equivalent.
- Added the MS #21 access campaign as a separate collection mechanism so simulated collector readiness cannot be mistaken for a technology equivalence gate.
- Added stale-evidence and tampered-fragment regression tests while preserving the canonical graph identity and every existing fail-closed production boundary.

How it differs from earlier work

MS #21 builds on MS #20 (Trusted Extension Evidence Contract). The earlier milestone established its own bounded capability; this milestone adds mainframe access readiness campaign while preserving the earlier evidence and its limits.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use mainframe access readiness campaign as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- This milestone establishes only the bounded capabilities and evidence listed here; later capabilities are not retroactive.
- Production readiness and platform equivalence require the explicit evidence and policy gates applicable to the customer environment.

Source of record

- CHANGELOG.md release section(s): 0.21.0, 0.21.1
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity

The underlying schemas, receipts, ledgers, tests, and policy decisions remain authoritative when greater detail is required.
