

CUSTOMER MILESTONE BRIEF

MS #51 - Oracle Native Execution Admission Gate

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.51.0
Date	2026-09-01
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #51 - Oracle Native Execution Admission Gate converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Defines the admissible evidence required before an Oracle 19c or 26ai conformance claim can be accepted.

Why this matters to a customer

Defines the admissible evidence required before an Oracle 19c or 26ai conformance claim can be accepted.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A content-addressed manifest mapping all 500 behaviors and 2,000 catalog cases to both 19c and 26ai, defining 4,000 required native executions.
- A 20-batch version/domain run-pack index with exact case counts and visible harness-materialization and execution states.
- A native execution contract binding database and session identity, expectation, harness and observation hashes, diagnostics, timestamps, runner identity, and runtime-key signatures.
- External-wallet-only authentication and a no-credential, no-raw-output repository policy.
- A strict receipt verifier rejecting unsigned evidence, unknown or duplicate cases, version or binding drift, unsafe security posture, partial promotion, and overclaims.
- Three JSON Schemas, deterministic artifacts, cross-platform CLI verification, and adversarial admission tests.

How it differs from earlier work

MS #50 completed 2,000 bounded cases with native counts at zero. MS #51 maps them to 19c and 26ai and defines the signed gate for future native runs.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use oracle native execution admission gate as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- Release 0.51.0 materializes zero of 4,000 SQL harnesses and executes zero cases on an authorized Oracle database.
- The MS #49 eight-fixture SQL file lacks per-case native observations and is ineligible as catalog-native evidence.
- A signed partial receipt proves only its cases; it cannot promote a database lane to conformance.
- A lane becomes conformant only after all 2,000 cases pass against one bound database identity and the exact SQL harnesses.
- Native Oracle conformance does not establish target equivalence.
- No credentials, wallets, verification keys, or raw SQL output are committed.
- iDempiere equivalence, CloudBank mapping, migration completion, and production readiness remain false.
