

CUSTOMER MILESTONE BRIEF

MS #45 - SAP ASE Semantic Source Adapter

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.45.0
Date	2026-08-31
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #45 - SAP ASE Semantic Source Adapter converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Lets a customer measure SAP ASE semantic risk before choosing a migration target or accepting a database-conversion claim.

Why this matters to a customer

Lets a customer measure SAP ASE semantic risk before choosing a migration target or accepting a database-conversion claim.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A target-neutral SAP ASE SourceAdapter for discovery, privacy-safe profiles, sealed extraction, replication resume, and transaction capabilities.
- A 2-table, 31-column catalog with 4 UDTs, 2 identity columns, 5 constraints, 3 indexes, 6 procedures, and 4 triggers.
- A 187-case corpus across types, UDTs, identity, money, datetime, strings, Transact-SQL, stored logic, locking, rollback, and replication.
- A 107-entry, five-class compatibility ledger covering every catalog object and 54 ASE behaviors.
- Twelve gates, five schemas, ten artifacts, cross-platform launchers, and adversarial overclaim tests.

How it differs from earlier work

Earlier DB2 and Oracle work proved narrower paths. MS #45 qualifies a broader, target-neutral ASE boundary across data, transactions, replication, Transact-SQL, procedures, and triggers before any target claim.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use sap ase semantic source adapter as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- Catalog, rows, replication, and transactions are fixtures, not live ASE observations.
- Stored logic is inventoried, not natively executed or complete.
- No target is selected; PostgreSQL and Oracle qualification remain future pilot work.
- Live equivalence, migration completion, and production readiness remain false.

Source of record

- CHANGELOG.md release section(s): 0.45.0
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity

The underlying schemas, receipts, ledgers, tests, and policy decisions remain authoritative when greater detail is required.
