

CUSTOMER MILESTONE BRIEF

MS #66 - CloudBank Whole-Application Dual-Lane Equivalence

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.66.0
Date	2026-09-03
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #66 - CloudBank Whole-Application Dual-Lane Equivalence converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Shows that the complete eight-service business system produces the same bounded outcomes before and after its Oracle-to-PostgreSQL modernization, including failure and recovery behavior.

Why this matters to a customer

Shows that the complete eight-service business system produces the same bounded outcomes before and after its Oracle-to-PostgreSQL modernization, including failure and recovery behavior.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A signed MS #61/MS #64 chain with the same evidence key and PostgreSQL image identity.
- Isolated Oracle/source and PostgreSQL/target lanes covering all eight deployables.
- Per-service executable identity, readiness, full-stack restart, and extra Account, Transfer, and Checks restart evidence in each lane.
- One exact 18-scenario contract covering business reads, identity, transfers, Checks, Credit Score, Chatbot, failures, concurrency, restarts, and recovery.
- Separately signed lane observations bound to one run, both receipts and images, and exact contracts; only matching normalized results pass.
- A compatibility ledger, three schemas, cross-platform launchers, CI, Control Tower projection, documentation, safe diagnostics, and adversarial tests.

How it differs from earlier work

MS #61 proved the native Oracle/PostgreSQL core and MS #64 completed all eight target workcells. MS #66 joins those evidence chains and requires complete source and target runtime observations before bounded whole-application equivalence can pass.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank whole-application dual-lane equivalence as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The committed readiness receipt proves gate readiness; it does not claim that this workspace started either native eight-service lane.
- A passing execution receipt proves only the 18 declared synthetic business scenarios, not identical internals.
- Credit Score is compared by range and Chatbot at its bounded service boundary, not by real decision or model-answer quality.
- Production data, native CDC, customer infrastructure and IdP, migration completion, deployment, and production readiness remain for MS #67-#68.
