

CUSTOMER MILESTONE BRIEF

MS #02 - Verified Java and Spring Batch Candidate

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.2.0 (historical second commit)
Date	2026-08-10
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #2 - Verified Java and Spring Batch Candidate converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Proves that a modern implementation can be built and checked automatically against the source-faithful oracle instead of relying on manual code review.

Why this matters to a customer

Proves that a modern implementation can be built and checked automatically against the source-faithful oracle instead of relying on manual code review.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- An auditable Java 17, Spring Boot, and Spring Batch modernization candidate.
- CardDemo-compatible fixed-width input and output codecs.
- COBOL overpunch decoding and encoding in the modern implementation.
- Unit, packaging, differential, cross-platform, and CI verification paths.
- Separation of batch orchestration from the business transformation.

How it differs from earlier work

MS #2 builds on MS #1 (Source-Faithful Local Oracle). The earlier milestone established its own bounded capability; this milestone adds verified java and spring batch candidate while preserving the earlier evidence and its limits.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use verified java and spring batch candidate as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- Passing the local oracle proves bounded development equivalence, not z/OS equivalence.
- The candidate covers the selected INTCALC slice rather than the full CardDemo estate.
- Live operational characteristics remain outside the claim.

Source of record

- CHANGELOG.md release section(s): 0.2.0 (historical second commit)
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity

The underlying schemas, receipts, ledgers, tests, and policy decisions remain authoritative when greater detail is required.
