

CUSTOMER MILESTONE BRIEF

MS #31 - Customer Estate Assessment Planner

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.31.0, 0.31.1
Date	2026-08-29 to 2026-08-30
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #31 - Customer Estate Assessment Planner converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Partitions the analyzed estate into coherent application slices and creates an evidence-aware plan without automatically selecting business priorities.

Why this matters to a customer

Partitions the analyzed estate into coherent application slices and creates an evidence-aware plan without automatically selecting business priorities.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- Added a deterministic customer estate assessment bound to the exact intake, source-analysis receipt, graph identity, and published assessment policy.
- Partitioned the typed source graph into connected application slices with stable identifiers, source files, technologies, relationship types, unresolved references, and evidence needs.
- Added an explicit boundary-closure wave for absent or ambiguous targets, followed by human-governed pilot selection, development proof, and blocked authorized-native validation.
- Added technology-specific modernization patterns and development/live evidence backlogs for COBOL, PL/I, JCL, Db2, CICS, HLASM, IMS, and VSAM.

- Added fail-closed controls preventing assessment tampering, hidden unresolved references, business-priority inference, automatic factory dispatch, or live-readiness promotion.
- Added JSON and Markdown assessment artifacts, POSIX and PowerShell assess commands, a v3 pilot dossier, frozen v1 assessment and v3 dossier schemas, and an eight-artifact deterministic rehearsal.
- Kept every planning result advisory and source-only; model qualification, authorized original execution, signed live equivalence, mainframe equivalence, and production readiness remain false or blocked.
- Added one shared fail-closed contract for `qualification_eligible`, `promotion_allowed`, `production_ready`, and `mainframe_equivalent`, then applied it to the historical model-evidence bridge and pinned all four claims in regression tests.
- Added a repository-wide audit that rejects committed receipt overclaims and literal source promotions without an explicit authority implementation.
- Made the pinned AWS CardDemo fixture a visible prerequisite for complete tests; missing data can only be accepted through an explicitly labelled unit-only mode.
- Added a content-addressed catalog for all 33 paired POSIX and PowerShell entry points, including purpose, role, and verification ownership, plus restored missing `oracle.sh` and `test.sh` twins.
- Added mainframe-access and z/OSMF adapter verification to the complete verifier and restored the missing Windows migration-rehearsal and collection-appliance stages.
- Added a JDK 17-or-newer compiler preflight with actionable diagnostics for old runtimes and JREs that do not expose `jdk.compiler`.
- Kept all live-system, model-qualification, mainframe-equivalence, promotion, and production claims false; this patch hardens proof boundaries but does not create new live evidence.

How it differs from earlier work

MS #31 builds on MS #30 (Customer Source Analysis Workcell). The earlier milestone established its own bounded capability; this milestone adds customer estate assessment planner while preserving the earlier evidence and its limits.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use customer estate assessment planner as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- Kept every planning result advisory and source-only; model qualification, authorized original execution, signed live equivalence, mainframe equivalence, and production readiness remain false or blocked.
- Kept all live-system, model-qualification, mainframe-equivalence, promotion, and production claims false; this patch hardens proof boundaries but does not create new live evidence.

Source of record

- CHANGELOG.md release section(s): 0.31.0, 0.31.1
- README.md product and operating guidance
- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity

The underlying schemas, receipts, ledgers, tests, and policy decisions remain authoritative when greater detail is required.
