

CUSTOMER MILESTONE BRIEF

MS #57 - CloudBank Customer Production-Readiness Qualification

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete - execution passed
Release	0.57.0
Date	2026-09-02
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Published execution result

Published 2026-09-11: Bounded Customer qualification. The original signed receipt is retained in the completed MS67 evidence chain.

Executive summary

MS #57 - CloudBank Customer Production-Readiness Qualification converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Deepens the proven Customer migration with shared HTTP, security, transaction, packaging, and rollback evidence while keeping whole-CloudBank and production claims explicitly gated.

Why this matters to a customer

Deepens the proven Customer migration with shared HTTP, security, transaction, packaging, and rollback evidence while keeping whole-CloudBank and production claims explicitly gated.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A receipt-gated native qualification that recreates isolated Oracle and PostgreSQL workspaces from the exact pinned source and MS #56 transformation.
- One shared five-test Spring, MockMvc, and JDBC contract for authentication, owner and administrator authorization, HTTP errors, concurrent read-committed visibility, rollback and commit, maximum lengths, and empty-string normalization.
- Removal of inherited Oracle UCP from the PostgreSQL target dependency path while retaining the unchanged Oracle reference lane.

- An executable Spring Boot JAR gate requiring one PostgreSQL driver and zero Oracle runtime libraries.
- A deterministic 10,000-row synthetic aggregate profile with no persisted rows and no production data.
- An offline simulated change journal, checkpoint resume, reconciled cutover barrier, injected failure, and exact rollback rehearsal.
- A signed execution receipt bound to the MS #56 receipt, both immutable database images, all qualification contracts, aggregate results, and strict false production claims.
- Progress-reporting cross-platform launchers, JSON Schemas, Control Tower status, CI checks, deterministic documentation, and tamper and overclaim tests.

How it differs from earlier work

MS #56 proved one bounded Customer Spring contract on Oracle and PostgreSQL. MS #57 chains from that signed result and adds production-shaped qualification for the same workcell without silently extending evidence to other CloudBank services.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank customer production-readiness qualification as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- These boundaries describe MS #57's own evidence scope. Later MS65, MS66 and MS67 receipts add their separate nonproduction qualifications; they do not rewrite this milestone's signed fields.
- Execution requires the operator-held signed MS #56 receipt and the same verification key.
- The data profile is deterministic synthetic aggregate evidence, not an authorized production extract.
- CDC, checkpoint, cutover, and rollback are offline simulations rather than native replication or production operations.
- No OCI image is built or scanned, and no production deployment is exercised.
- Account, transfer, messaging, MicroTx LRA, and all other CloudBank services remain unqualified.

- Whole-CloudBank equivalence, migration completion, production-data equivalence, and production readiness remain false.
