

CUSTOMER MILESTONE BRIEF

MS #63 - CloudBank Checks Durable Messaging

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete - execution passed
Release	0.63.0
Date	2026-09-02
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Published execution result

Published 2026-09-11: Checks durable messaging. The original signed receipt is retained in the completed MS67 evidence chain.

Executive summary

MS #63 - CloudBank Checks Durable Messaging converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Replaces Oracle AQ/JMS check processing with an evidence-gated PostgreSQL durable queue that makes ordering, retry, redelivery, and dead-letter behavior reviewable.

Why this matters to a customer

Replaces Oracle AQ/JMS check processing with an evidence-gated PostgreSQL durable queue that makes ordering, retry, redelivery, and dead-letter behavior reviewable.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- A signed MS #62 receipt chain and isolated five-service target materialized from the exact pinned CloudBank source and generated PostgreSQL/OAuth target.
- A fourteen-path transformation replacing Oracle AQ/JMS in Checks and Test Runner with a PostgreSQL durable queue.
- Required idempotency keys and per-aggregate FIFO fencing for deposit and clearance messages.
- Exclusive FOR UPDATE SKIP LOCKED claims, bounded leases, crash redelivery, retry backoff, poison-message dead-lettering, and governed replay.

- Checks-to-Account delivery using the MS #62 OAuth client-credentials provider and the message identity as the downstream idempotency key.
- Five executable Spring Boot JARs with zero Oracle AQ/JMS, Oracle JDBC/UCP, and MicroTx runtime libraries.
- Twelve native PostgreSQL queue scenarios with safe aggregate diagnostics and synthetic data only.
- Deterministic messaging, execution, acceptance, compatibility, readiness, and receipt contracts; cross-platform launchers; CI compilation; Control Tower projection; documentation; and adversarial tests.

How it differs from earlier work

MS #62 qualified the bounded Authorization, Account, and Transfer OAuth application boundary. MS #63 carries that service identity into Checks and Test Runner while replacing their Oracle AQ/JMS transport with explicitly governed PostgreSQL queue semantics.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use cloudbank checks durable messaging as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- These boundaries describe MS #63's own evidence scope. Later MS65, MS66 and MS67 receipts add their separate nonproduction qualifications; they do not rewrite this milestone's signed fields.
- A passing receipt qualifies the target-side Checks messaging mechanics and generated workcell, not a native Oracle AQ comparison.
- Oracle/PostgreSQL messaging equivalence remains false until an authorized native Oracle AQ comparison exists.
- Credit Score and Chatbot remain for MS #64.
- No production data, whole-application equivalence, migration completion, production deployment, promotion, or production readiness is claimed.
