

CUSTOMER MILESTONE BRIEF

MS #44 - Milestone Documentation System

Purpose, customer value, delivered capability, evidence, and claim boundaries

Status	Complete
Release	0.44.0, 0.44.1
Date	2026-08-31
Audience	Customers, partners, executives, architects, delivery teams, and assurance reviewers

Executive summary

MS #44 - Milestone Documentation System converts a specific part of the LIGHTYEAR modernization approach into a governed, reviewable capability. Turns the engineering history into a consistent customer-ready and auditable body of record across Markdown, Word, and PDF.

Why this matters to a customer

Turns the engineering history into a consistent customer-ready and auditable body of record across Markdown, Word, and PDF.

The practical result is a narrower, evidence-backed decision instead of a broad modernization claim. Commercial, architecture, delivery, security, and assurance teams can review the same capability, proof, and limits.

What the milestone delivers

- Forty-four canonical milestone narratives covering MS #1 through MS #44.
- Matching Markdown, DOCX, and PDF artifacts for every milestone.
- A responsive browser index with full-text search across milestone number, title, customer value, capability, boundary, release, and roadmap phase.
- Absolute GitHub links for Markdown and PDF plus direct-download links for Microsoft Word, including when the index is viewed outside GitHub.
- GitHub Pages publication for the interactive milestone library.
- A deterministic generator and content-addressed artifact manifest that also governs the Markdown and HTML indexes.

- A fail-closed verifier that detects missing, changed, stale, or extra milestone artifacts.
- Roadmap governance that reserves MS #45 for the SAP ASE semantic source adapter.

How it differs from earlier work

MS #44 builds on MS #43 (Oracle Source and Stored-Procedure Qualification). The earlier milestone established its own bounded capability; this milestone adds milestone documentation system while preserving the earlier evidence and its limits.

Earlier evidence is not automatically promoted into this milestone. A parser, simulator, local comparison, or generated artifact is not live platform equivalence or production readiness.

What a customer can do with it

A customer can use milestone documentation system as a bounded decision and delivery capability, attached to approved sources, owners, policies, target architecture, acceptance criteria, and authorized evidence.

Unresolved semantic loss, policy decisions, unsupported behavior, and live-evidence requirements remain visible.

Evidence and acceptance posture

The repository capability is complete because its committed implementation and release record are present. Customer qualification remains claim-specific and evidence-class-specific.

Review exact source and artifact identities, distinguish development from authorized live evidence, inspect policy and loss classifications, confirm passed and blocked gates, and verify that later changes have not invalidated the evidence.

Boundaries and claims not made

- The documents explain and package existing evidence; they do not create new technical qualification or live-system evidence.
- Search is performed locally in the browser over the published customer-readable milestone metadata; it is not a search of underlying receipts or customer source code.
- A customer-facing narrative does not override the underlying receipts, ledgers, gates, or explicit false claims.
- Regeneration is required whenever the catalog, changelog, or documentation generator changes.

Source of record

- CHANGELOG.md release section(s): 0.44.0, 0.44.1
- README.md product and operating guidance

- LIGHTYEAR-ROADMAP.md governing sequence and claim classifications
- docs/milestones/catalog.json metadata and docs/milestones/manifest.json artifact integrity

The underlying schemas, receipts, ledgers, tests, and policy decisions remain authoritative when greater detail is required.
